

Overview of Changes in Brook Trout Distribution on the Credit River Watershed

- First Map - First Image is the estimate of brook trout distribution pre-settlement. This is based on historical records, diaries, etc.
- Second Map - The second image is based on data from the Department of Planning and Development circa 1950s. There is a likely error for the Black/Silver Creek subwatersheds. It indicates no brook trout but this is because this subwatershed was not sampled during the 1950s study.
- Third Map – This info is based on the MNR fish distribution information with most of the information consolidated in the 1990s with modest updates into the 2000s. There are anomalies here as well since the main West Credit indicates no brook trout whereas a tributary does contain trout....this is an error in the data.
- Fourth Map – This is the current distribution based on the CVC data from recent electrofishing surveys over the last 5-8 years.
